TOPOGRAPHIC REGIONS

Valleys - flat-lying land along the major streams. The materials of the valleys are stream-deposited silt, clay, sand, and gravel.

Rolling Hills - hilly land with moderate to steep slopes and rounded ridge crests. In eastern Nebraska, the Rolling Hills are mostly glacial till that has been eroded and marked by loess, while in northwestern Nebraska the hills were produced by the erosion of clay and clay-shale beds.

Plains - flat-lying land which lies above the valley. The materials of the plains are sandstone or stream-deposited silt, clay, sand, and gravel overlain by wind-deposited silt (loess).

Dissected Plains - hilly land with moderate to steep slopes, sharp ridge crests, and remnants of the old, nearly level plain. The Dissected Plains are old plains eroded by water and wind.

Sand Hills - hilly land composed of low to high dunes of sand stabilized by a grass cover. The sand dunes mantle stream-deposited silt, sand, gravel, and sandstone.

Valley-Side Slopes - moderately sloping land which occurs between the escarpments and the major stream valleys in western Nebraska. These areas are mostly covered by a few feet to a few tens of feet of sand, gravel, or silt.
